Surgical instruments for plastic surgery operations in Ancient Greek and Byzantine times

Marios Papadakis

Abstract

Background-Objective: Even though the term "plastic surgery" was first introduced in the 19th century, the study of ancient Greek and Byzantine medical manuscripts reveals a significant number of plastic surgery operations performed during these periods. The aim of this work is to present the surgical instruments that were used to conduct such operations.

Material-Method: The original manuscripts of ancient Greek and Byzantine physicians, including Hippocrates, Galen, Oribasius, Aetius, Paul of Aegina and Alexander of Tralles, were studied and analysed. The references concerning plastic surgery instruments were marked and are presented.

Results-Discussion: Ancient Greek and Byzantine physicians performed several plastic surgery procedures, i.e. reconstructions of defects in the nose, ears, eyelids, lips, cheeks, and forehead, while surgical restoration of female breasts, hypospadias, elderly loose jawbone, penile tumours, syndactyly, and polydactyly was also described in detail. Several surgical instruments with various functions were used for these procedures, such as tools for tissue cutting (scalpels, chisels), for tissue grasping (forceps), tissue preparation, haemostasis (cauteries), as well as tissue suturing. Many of these tools had a wide range of uses, while others appear to have been specifically designed for plastic surgery procedures.
Introduction

Despite the emphasis on scientific knowledge, the practice of surgery remains fundamentally a manual craft, as the etymology of the word suggests (from Latin, chirurgia; Greek: χειρ or kheir = hand, ἐργο or ergo = work). Similar to other crafts, the development of tools and instruments has played a crucial role in facilitating, expanding, and refining surgical practices, addressing situations where manual dexterity alone proves inadequate or impractical. It is speculated that the earliest surgical instruments were adapted from everyday objects used in domestic, artisanal, and potentially military contexts, and that the initial need for instrumental intervention arose from injuries such as severe wounds, foreign bodies lodged in tissues, and complex fractures. Although there is concrete evidence of early surgical procedures involving skull trepanation for trauma or epilepsy and circumcision for cultural or hygienic reasons, the exact origins of these interventions remain uncertain, reaching back into ancient times.

Material and Methods

The research and analysis of ancient operations and instruments in plastic surgery were based on (a) Ancient Greek Literature as found in the Thesaurus Linguae Graecae (TLG), (b) the study of classical medical and historical writings, and (c) the search for contemporary literature on the history of plastic surgery in reputable medical databases (ISI, PubMed).

Results

The surgical instruments that were found are presented in the table below. The operations performed represent the whole spectrum of plastic surgery, i.e. reconstructive surgery, hand surgery and aesthetic surgery.

Discussion

The Byzantine period witnessed a continuous lineage of physicians who meticulously collected, systematised and expanded upon the medical wisdom inherited from their Greco-Roman predecessors. These physicians’ medical encyclopaedias formed the foundation of Arabic medical knowledge and served as standard textbooks in Western medicine until the Early Modern period, spanning from the 16th to the late 18th century. Byzantine plastic surgery, as evident from the surgical content predominantly found in the writings of Oribasius of Pergamon and Paul of Aegina, appeared to have reached a highly advanced state of development.

The surgical instruments found to be used in plastic surgery operations can be classified as follows:

(a) tissue-cutting instruments, e.g. anarraphikon smilion, epacmon psalidion, pterygotomus. Chisels were mainly made of iron in various shapes and sizes, hence the many different names, while scissors were made of both copper and iron.

(b) tissue-exploration instruments, e.g. mele, coparion.

Conclusion: Ancient Greek and Byzantine physicians possessed a comprehensive set of surgical instruments that effectively supported a wide range of plastic surgery procedures.

lepton. Probes were often combined with other tools, and their tip was sharp, rounded, or oval. They were mainly made of lead or tin. Here we should emphasise the confusion between “probe” and “scalpel”. Although Paul of Aegina replaces the word “probe” with the word “scalpel” when reproducing a text by Hippocrates, the French translator René Briau translates “scalpel” as “needle”, believing that it comes from the verb “to cut”. However, Milne considers that “scalpel” is identical to “probe”, noting that “there is generally great confusion between the words denoting probes and those denoting needles”. Besides tissue exploration, probes were also used for local application of substances, mainly ointments.

(c) tissue-grasping (forceps) and holding (hooks) instruments, e.g. blepharocatochus, ancistron. Celsos uses only one term for forceps, unlike the many Greek terms, due to the easier derivation in the Greek language than in Latin.

(d) tissue-preparation instruments, e.g. melotris.

(e) tissue-suturing instruments, e.g. ancter.

(f) haemostatic instruments (cauteries), e.g. crescent-shaped cautery, fine cautery. In the Hippocratic collection, they are also designated by the term “iron”, as they were almost always made of iron (which is a good heat conductor).

(g) draining instruments, e.g. calamis.

(h) cryotherapy instrument, i.e. cold cautery, psychrocauterion.

(i) filling materials, e.g. spheniscus.

(j) bandaging materials, e.g. strap (epidesmos).

(k) anti-adhesion materials, e.g. lemniscus.

CONCLUSION

In conclusion, ancient Greek and Byzantine physicians possessed a comprehensive set of surgical instruments that effectively supported a wide range of plastic surgery procedures.

ΠΕΡΙΛΗΨΗ

Χειρουργικά εργαλεία χρησιμοποιούμενα στην Πλαστική Χειρουργική κατά την Αρχαία Ελληνική και Βυζαντινή Περίοδο

Μάριος Παπαδάκης

Εισαγωγή: Παρά το γεγονός ότι ο όρος «πλαστική χειρουργική» εισήχθη για πρώτη φορά τον 19ο αιώνα, η μελέτη των αρχαίων ελληνικών και βυζαντινών ιατρικών χειρουργών αποκαλύπτει έναν σημαντικό αριθμό επεμβάσεων πλαστικής χειρουργικής κατά τη διάρκεια αυτών των περιόδων. Σκοπός αυτής της εργασίας είναι να παρουσιάσει τα χειρουργικά εργαλεία που χρησιμοποιήθηκαν για τη διενέργεια αυτών των επεμβάσεων.
Υλικό-Μέθοδος: Εξετάστηκαν και αναλύθηκαν τα πρωτότυπα κείμενα των αρχαίων Ελλήνων και Βυζαντινών ιατρών, συμπεριλαμβανομένων των Ιπποκράτη, Γαληνού, Ορίβασίου, Αιτίου, Παύλου του Αιγινήτου και Αλεξάνδρου του Τραλλιανού. Οι αναφορές που σχετίζονται με τα εργαλεία πλαστικής χειρουργικής σημειώθηκαν και παρουσιάζονται.

Αποτελέσματα-Συζήτηση: Οι αρχαίοι Έλληνες και βυζαντινοί ιατροί πραγματοποιούσαν αρκετές επεμβάσεις πλαστικής χειρουργικής, όπως αποκατάστασης ελλειμμάτων στη μύτη, τα αυτιά, τις βλεφαρίδες, τα χείλη, τις παρειές, το μέτωπο, ενώ περιγράφεται επίσης αναλυτικά η χειρουργική αποκατάσταση μαστού, υποσταδία, χαλαρού οσχέου σε ήλικωμένους, όγκων πέους, συνδεκτοσιαλίας και πολυδακτυλίας. Παρατηρώ τις επεμβάσεις χειρουργικής αποκατάστασης μεγάλου αριθμού χειρουργικών εργαλείων με διάφορες λειτουργίες, όπως εργαλεία κοπής ιστών, εργαλεία σύλληψης και παρασκευής ιστών, αιμόστασης, καθώς και συρραφής. Πολλά από αυτά τα εργαλεία είχαν ευρύ φάσμα χρήσης, ενώ άλλα φαινόταν να έχουν σχεδιαστεί ειδικά για τις επεμβάσεις πλαστικής χειρουργικής.

Συμπέρασμα: Οι αρχαίοι Έλληνες και βυζαντινοί ιατροί διέθεσαν ένα πλήρες και ευρείας σετ εργαλείων που υποστήριζαν αποτελεσματικά μια ευρεία γκάμα επεμβάσεων πλαστικής χειρουργικής.

Λέξεις κλειδία: Χειρουργικά εργαλεία, πλαστική χειρουργική, αρχαιότητα, Βυζαντιού
