The genus *Amblyseius* (Acari: Phytoseiidae) in Greece, with the Description of a New Species[1]

G.TH. PAPADOULIS AND N.G. EMMANOUEL

Laboratory of Agricultural Zoology and Entomology, Agricultural University of Athens, Iera Odos 75, 118 55 Athens, Greece

ABSTRACT

A nationwide survey on Phytoseiid mites in Greece revealed the occurrence of 19 species belonging to the Genus *Amblyseius*. A key and illustrations of all these species are given along with the synonyms, habitats and distribution data. A new species, *A. makedonicus*, found on *Oryza sativa*, is described.

Introduction

Phytoseiid mites are well known predators of injurious arthropods and for this reason numerous studies have been made in many parts of the world. In Greece prior to the studies of the authors in 1982 the only references on Phytoseiid mites were those of: Wainstein (1969), Swirski and Ragusa (1976, 1977), Hatzinikolis (1977), Mc Murtry (1977), and Papaioannou - Souliotis (1981). During the present survey many species belonging to the genera *Amblyseius* Berlese, *Typhlodromus* Scheuten, *Phytoseius* Ribaga and *Phytoseiulus* Evans were found, some of which were new to science (Papadoulis and Emmanouel 1988, 1990, 1991a, 1991b, 1992).

The present paper deals with all species belonging to *Amblyseius*. *Amblyseius makedonicus* spec. nov. is described and illustrated. All other species are also illustrated, most of them in more detail than previously.

Material and Methods

Commencing in 1982 many samples of various wild and cultivated plants were collected throughout the year from many localities in Greece. Mites were extracted using the Berleze-Tulgren method or/and by direct observation under the binocular microscope. A Zeiss drawing tube was used for the illustrations. The setal nomenclature is based on the system of Lindquist and Evans (1965) as adapted for the family Phytoseiidae by Rowell et al. (1978). Other terminology follows Athias-Henriot (1975, 1977) for organotaxy, Evans and Till (1979) for the ventral pores and Wainstein (1973) for spermathecae. The dorsal and ventral setal pattern notation of Chant and Yoshida-Shaul (1989, 1991) is used. All measurements are given in microns for an average of 5 females. All specimens are deposited in the Acari collection of the Laboratory of Agricultural Zoology and Entomology, Agricultural University of Athens.

Results and Discussion

The present study revealed the presence of 19 *Amblyseius* species belonging to 8 species-groups. A key based on the female is provided. Synonyms, distributions and illustrations of all species found are also given.

Key to the adult females of the Greek species of the genus *Amblyseius*.

1. Setae J2 absent ..... *A. messor* (Wainstein)
– Setae J2 present 2
2. Interscutal membrane sclerotized; ventroanal shield fragmented into anal

[1] Received for publication December 31, 1991.

and ventral shields; all dorsal setae very short ..... *A. degenerans* (Berlese)
– Interscutal membrane not sclerotized; ventroanal shield entire 3
3. Setae j3, s4, Z4 and Z5 much longer than others dorsal setae which are very short; setae j1, z2, z4 and S2 may be relatively long, but not longer than setae j3; setae Z4 and Z5 very long and whip-like ..... *obtusus* group 4
– Without this combination of characters 6
4. Setae j1 longer than z4; Z4 and Z5 lightly serrated; s4 and Z4 subequal in length ..... *A. andersoni* (Chant)
– Setae j1 shorter than z4; Z4 and Z5 smooth; setae Z4 longer than s4 5
5. Spermatheca S-shaped; setae z4 and S2 subequal in length; macroseta on basitarsus IV longer than that on genu IV ..... *A. begljarovi* Abbasova
– Spermatheca bell-shaped; setae z4 much longer than S2; macroseta on basitarsus IV and genu IV subequal in length ..... *A. nemorivagus* Athias-Henriot
6. Ventroanal shield with one pair of preanal setae ..... *A. setosus* (Muma)
– Ventroanal shield with more than one pair of preanal setae 7
7. Ventroanal shield with preanal setae almost aligned in two transverse rows on the anterior third of the shield; setae JV1 usually in line with ZV2 ..... *finlandicus* group 8
– Preanal setae arranged in three transverse rows 9
8. Cervix of spermatheca tube-shaped; peritreme extenting to level of setae j3 ..... *A. stipulatus* (Athias-Henriot)
– Cervix of spermatheca not tube-shaped; peritreme short extending to level between the bases of setae z2 and z4 ..... *A. finlandicus* (Oudemans)
9. Dorsal shield with 16 pairs of setae (S4 absent) ..... *aberrans* group 10
– Dorsal shield with 17 pairs of setae (S4 present) 12
10. Tibia IV with 7 setae ..... *A. aberrans* (Oudemans)
– Tibia IV with 6 setae 11
11. Four pairs of setae on integument surrounding ventroanal shield ..... *A. keae* Papadoulis and Emmanouel
– Two pairs of setae on integument surrounding ventroanal shield ..... *A. hymetticus* Papadoulis and Emmanouel
12. Ventroanal shield elongated and slender, usually narrower than posterior margin of genital shield, with construction at the level of JV2 setae (vase-like) ..... *A. insuetus* Livshitz and Kuznetsov
– Ventroanal shield squarish, triangular or rectangular and broader than the posterior margin of genital shield ..... *cucumeris* group 13
13. Genu II with 9 setae ..... *A. graminis* Chant
– Genu II with fewer than 9 setae 14
14. Spermatheca with long neck (subequal in length with cervix) 15
– Spermatheca with short neck (less than cervix) or without neck 16
15. Fixed digit of chelicerae with one tooth; peritreme extending to level of j1 ..... *A. marginatus* (Wainstein)
– Fixed digit of chelicerae without teeth; peritreme extending to level of j3 ..... *A. cinstutus* Livshitz and Kuznetsov
16. Spermatheca without neck 17
– Spermatheca with short neck (less than the cervix) 18
17. Cervix of spermatheca bell-shaped ..... *A. cucumeris* (Oudemans)
– Cervix funnel shaped; major duct a broad tube ..... *A. barkeri* (Hughes)
18. Setae Z4, S4, S5 serrated; S5 longer than Z4 ..... *A. bicaudus* Wainstein
– Setae Z4, S4, S5, smooth; S5 shorter than Z4 ..... *A. makedonicus* spec. nov.

MESSOR GROUP

1. *Amblyseius messor* (Wainstein) (Figs. 1-6).

Typhlodromus messor Wainstein, 1960: 688.

Amblyseius messor (Wainstein); Athias-Henriot, 1961: 425; Athias-Henriot, 1966: 190; Swirski & Amitai, 1965: 132; Swirski & Amitai, 1968: 102; Livshitz & Kuznetsov, 1972: 21; Amitai & Wysoki, 1974: 45; Ragusa, 1977; 385; Wainstein, 1977: 1415; Amitai & Swirski, 1978: 130; Schicha, 1983: 111; Ragusa, 1985: 79; Papadoulis & Emmanouel, 1990: 14.

Amblyseius (Amblyseius) messor (Wainstein); Ehara, 1966: 22; Ueckermann & Loots, 1988: 66.

Amblyseius (Amblyseius) apheles Van der Merwe, 1968: 121 (Synonymy by Ueckermann & Loots, 1988).

Amblyseius obtusus (Koch); Womersley, 1954: 188.

Specimens examined: Kopais region, Co. Boiotia on several occasions during 1984-1990 on *Medicago sativa*.

Previous records: The type specimens were collected on Graminae in East Georgia, U.S.S.R. This species has been also recorded from: Algeria, Spain, Israel, Italy, U.S.S.R. and Australia.

DEGENERANS GROUP

2. *Amblyseius degenerans* (Berlese) (Figs. 7-11).

Seius degenerans Berlese, 1889, Acari Myr. Scorp., fasc. 54, No 9.

Iphiseius degenerans Berlese, 1921: 95; Evans, 1954: 517; Athias-Henriot, 1957: 335; Chant, 1959: 110; Swirski & Shechter, 1961: 97; Prichard & Baker, 1962: 299; Swirski & Amitai, 1961: 201; Carmona, 1962; Porath & Swirski,

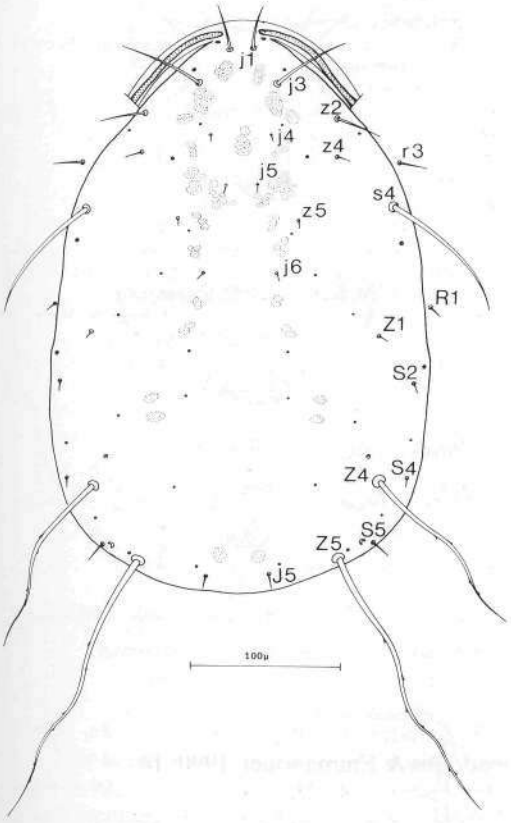

FIG. 1. *Amblyseius messor*: female, dorsal shield.

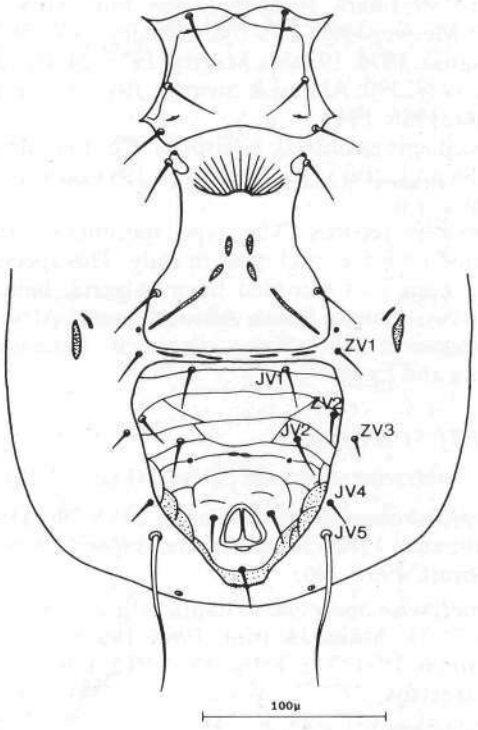

FIG. 2. *Amblyseius messor*: female, venter.

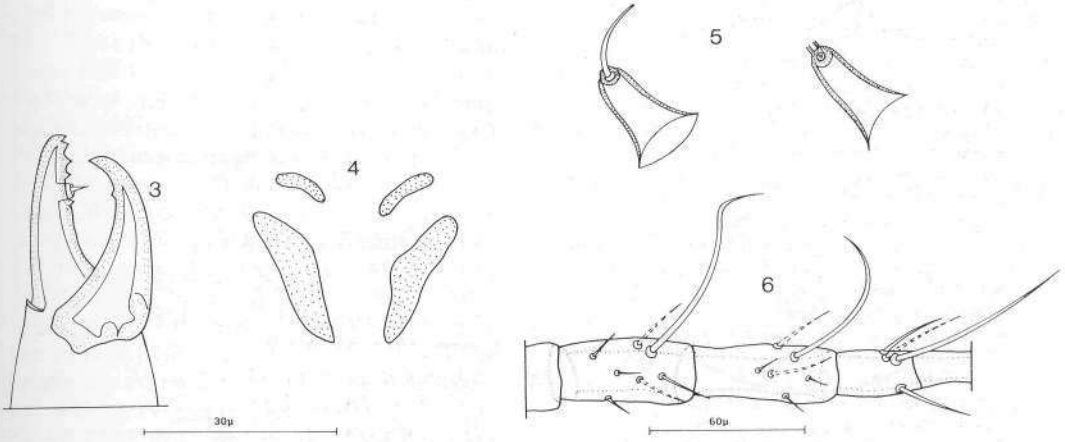

FIGS. 3-6. *Amblyseius messor*: 3 chelicerae of female, 4 metapodal plates, 5 spermatheca, 6 leg IV.

1965: 99; Ehara, 1966: 25; Dosse, 1967: 37; Van der Merwe, 1968: 105-108; Elbadry 1970: 502; Ragusa, 1976: 193; Mc Murtry, 1977: 24; Ragusa, 1977: 390; Amitai & Swirski, 1978: 133; Ragusa, 1986: 194.

Specimens examined: Kleisoura, Co. Ioannina, 1986 on *Citrus* spp.; Messologi, 1991 on *Citrus* spp.

Previous records: The type specimens were found on leaves and moss in Italy. This species has been also recorded from: Algeria, Israel, Turkey, Congo, South Africa, Central Africa, Tanganica, Hong-Kong, Portugal, Lebanon, Italy and Egypt.

OBTUSUS GROUP

3. *Amblyseius andersoni* (Chant) (Figs. 12-18).

Typhlodromus andersoni Chant, 1957: 296; Hirschmann, 1962: 24; Carmona, 1966: 189-191; Schruft, 1967: 190.

Amblyseius andersoni (Chant), Athias-Henriot, 1958: 33; Athias-Henriot, 1966: 195; Chant & Hansell, 1971: 715; Karg, 1971: 212; Livshitz & Kuznetsov, 1972: 23; Wainstein, 1973: 178; Kolodochka, 1973: 79; Kolodochka, 1978: 27-29;

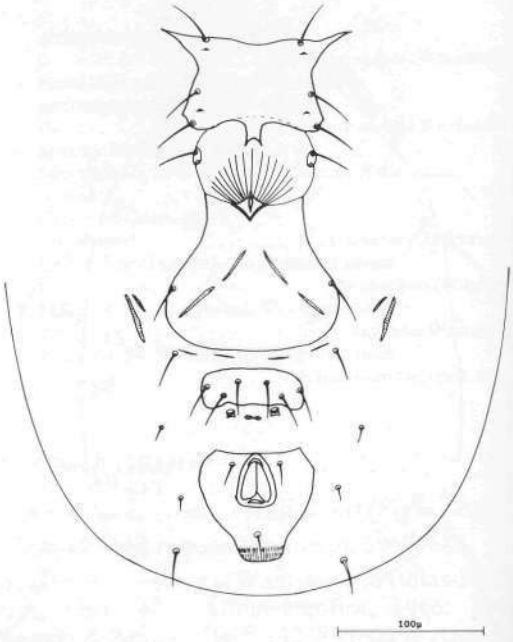

FIG. 8. *Amblyseius degenerans*: female, venter.

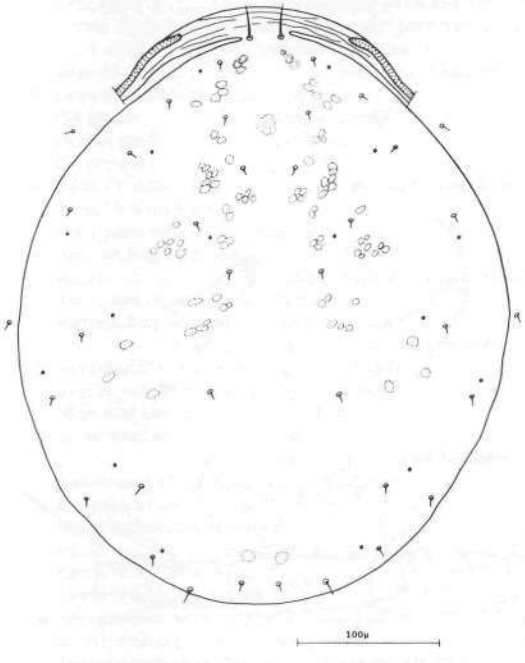

FIG. 7. *Amblyseius degenerans*: female, dorsal shield.

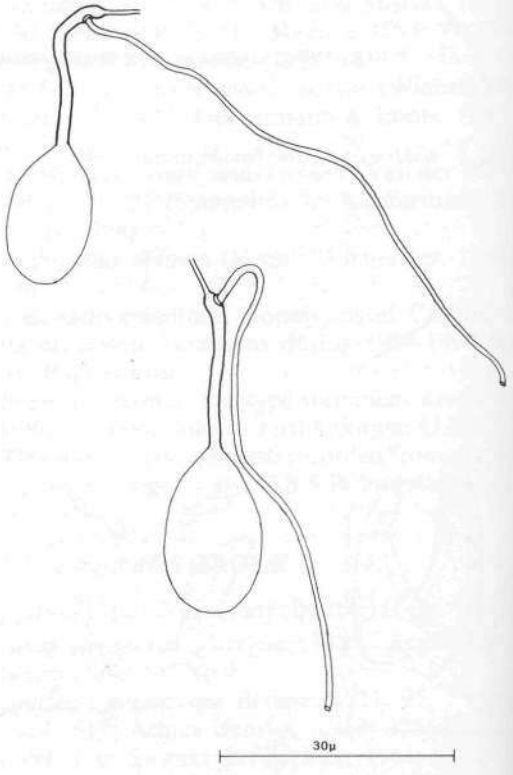

FIG. 9. *Amblyseius degenerans*: spermatheca.

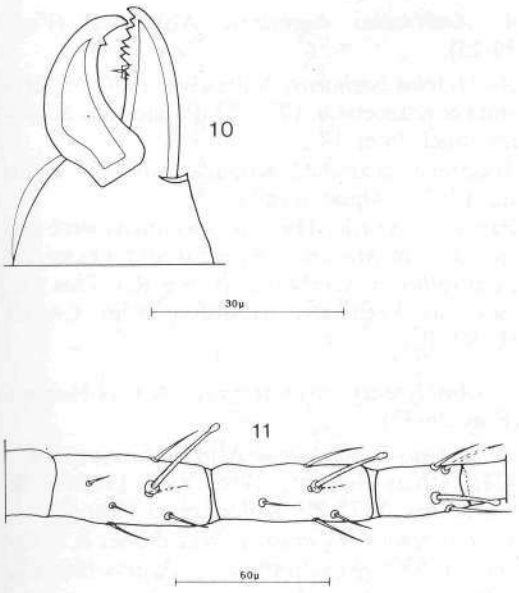

FIGS. 10-11. *Amblyseius degenerans*: 10 chelicerae of female, 11 leg IV.

Forest et al., 1981: 21-22; Lehman, 1982: 216-217; Karg, 1982; Chant & Yoshida-Shaul, 1990: 5-12.

Amblyseopsis potentillae Garman, 1958: 76-77 (Synonymy by Chant and Yoshida-Shaul, 1990).

Amblyseopsis potentillae (Garman), Mc Murtry, 1977: 21-22; Swirski & Ragusa, 1977: 81-82; Ragusa, 1985 82-84; Ragusa, 1986: 194.

Typhlodromus (Amblyseius) andersoni Chant, Chant, 1959: 92; Boczek, 1964: 366-367.

Typhlodromus (Amblyseius) britannicus Chant, 1959: 87-88 (Synonymy by Chant and Yoshida-Shaul, 1990).

Amblyseius (Amblyseius) andersoni (Chant), Muma, 1961: 287; Wainstein & Vartapetov, 1973: 103; Ueckermann & Loots, 1988: 73.

Typhlodromus (Typhlodromus) andersoni Chant, Westerboer & Bernhard, 1963: 682-689.

Amblyseius reflexus Knisley & Denmark, 1978: 8-10 (Synonymy by Denmark & Muma, 1989; confirmed by Chant and Yoshida-Shaul, 1990).

Amblyseius (Multiseius) andersoni (Chant), Denmark & Muma, 1989: 84.

Specimens examined: M. Gotista, Co. Ioannina, 1986 on *Prunus* sp.; Kleisoura, Co. Ioannina, 1986 on *Citrus* spp.; Preveza, 1987 on *Citrus* spp.; Kalamata, Co. Messinia, 1986 on *Citrus*

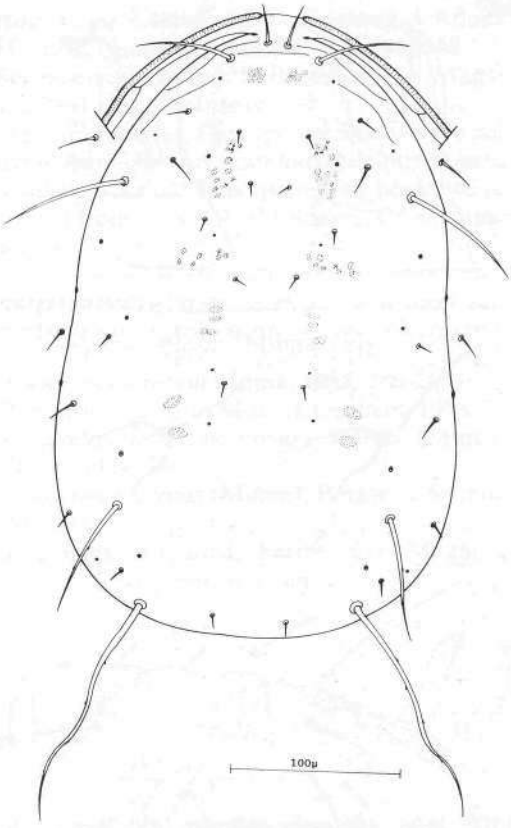

FIG. 12. *Amblyseius andersoni*: female, dorsal shield.

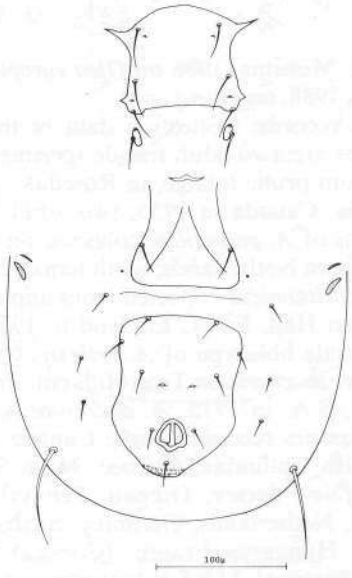

FIG. 13. *Amblyseius andersoni*: female, venter.

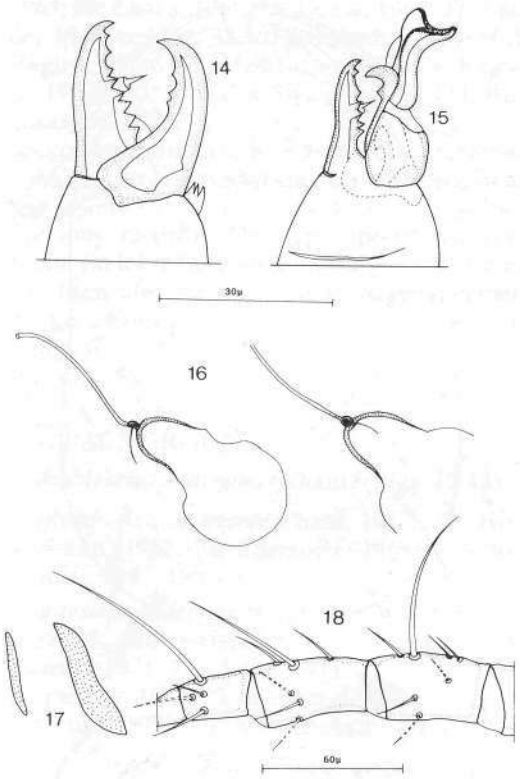

FIGS. 14-18. *Amblyseius andersoni*: 14 chelicerae of female, 15 chelicerae of male, 16 spermatheca, 17 metapodal plates, 18 leg IV.

spp.; Co. Messinia, 1986 on *Olea europea*; Co. Messinia 1988, on *Citrus* spp.
Previous records: Collection data of the type specimens are: two adult female specimens collected from prune foliage, in Rosedale, British Columbia, Canada in 1955; two adult female specimens of *A. potentillae* collected on *Potentilla* sp. from Netherlands; adult female holotype of *A. britannicus* collected from apple foliage, Penlan Hall, Essex, England in 1953; and adult female holotype of *A. reflexus* collected from *Acer saccharinum* Tron Hills country New Jersey, U.S.A. in 1975. *A. andersoni* is a well known species recorded from: Canada (Ontario, British Columbia, Quebec, Nova Scotia), U.S.A. (New Jersey, Oregon, Pennsylvania), England, Netherlands, Germany, Switzerland, Poland, Hungary, France (Corsica), Italy, Greece, Portugal, U.S.S.R. (Armenia, Crimea, Moldavia, Ukrania), Algeria and Iceland.

4. *Amblyseius begljarovi* Abbasova (Figs. 19-25).

Amblyseius begljarovi Abbasova, 1970: 52; Livshitz & Kuznetsov, 1972: 23; Papadoulis & Emmanouel, 1990: 14.
Specimens examined: Kopais region, Co. Boiotia, 1982 on *Opuntia* sp.
Previous records: The type specimens were collected from *Micromys minutus* and *Vespertilio pipistrellus* in Azerbaijan (U.S.S.R.). This species has been also recorded from Crimea (U.S.S.R.).

5. *Amblyseius nemorivagus* Athias-Henriot (Figs. 26-32).

Amblyseius nemorivagus Athias-Henriot, 1961: 424; Athias-Henriot, 1966: 197; Livshitz & Kuznetsov, 1972: 23; Kolodochka 1980: 45.
Typhlodromus hispaniensis Westerboer & Bernhard, 1963: 696 (Synonymy by Athias-Henriot, 1966).

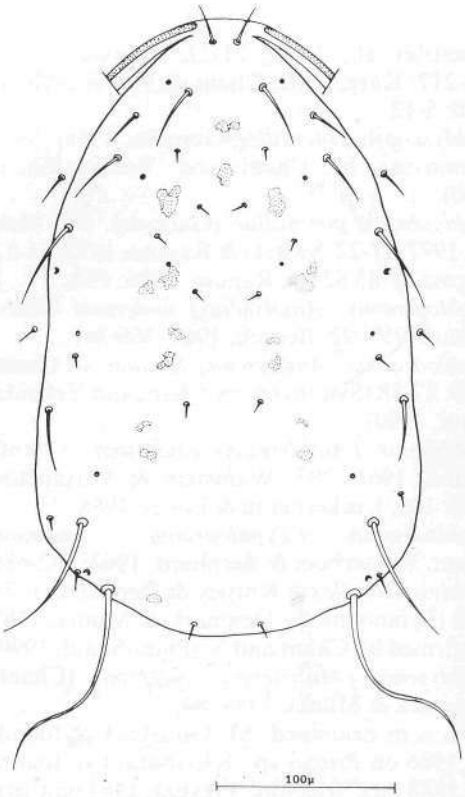

FIG. 19. *Amblyseius begljarovi*: female, dorsal shield.

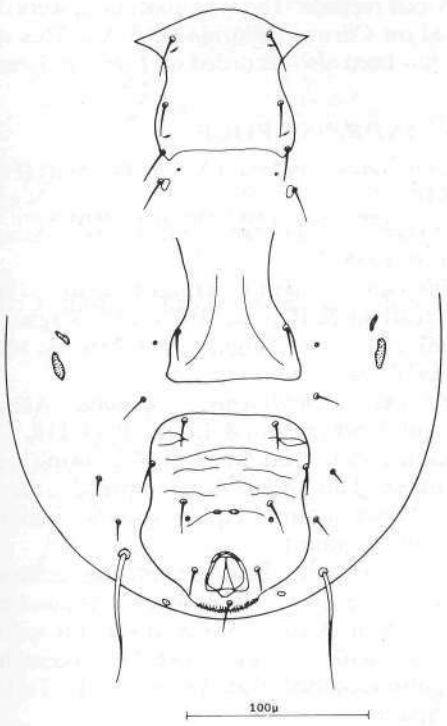

FIG. 20. *Amblyseius begljarovi*: female, venter.

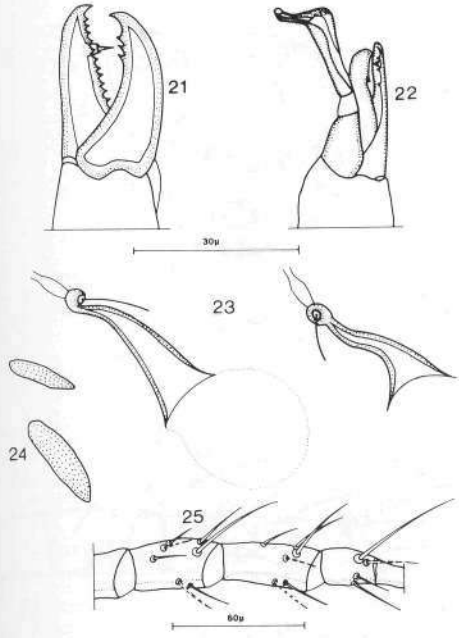

FIGS. 21-25. *Amblyseius begljarovi*: 21 chelicerae of female, 22 chelicerae of male, 23 spermatheca, 24 metapodal plates, 25 leg IV.

Amblyseius (Amblyseius) nemorivagus Athias-Henriot, Ueckermann and Loots, 1988: 67.
Specimens examined: Makrynitsa, Co. Magnisia, 1991 on Graminae.
Previous records: The type specimens were collected from *Quercus suber* and soil under *Laurus nobilis* in Algeria. This species has been also recorded from: U.S.S.R. (Moldavia, Crimea) and Spain.

SETOSUS GROUP

6. *Amblyseius setosus* (Muma) (Figs. 33-38).

Amblyseiella setosa Muma, 1955: 266-268.
Phytoseiulus setosa (Muma), Garman, 1958: 70.
Typhlodromus (Amblyseius) setosus (Muma), Chant, 1959: 70.
Amblyseius setosus (Muma), Porath & Swirski, 1965: 97.
Specimens examined: Ferres, Co. Magnisia, 1990 on *Gossypium hirsutum*.

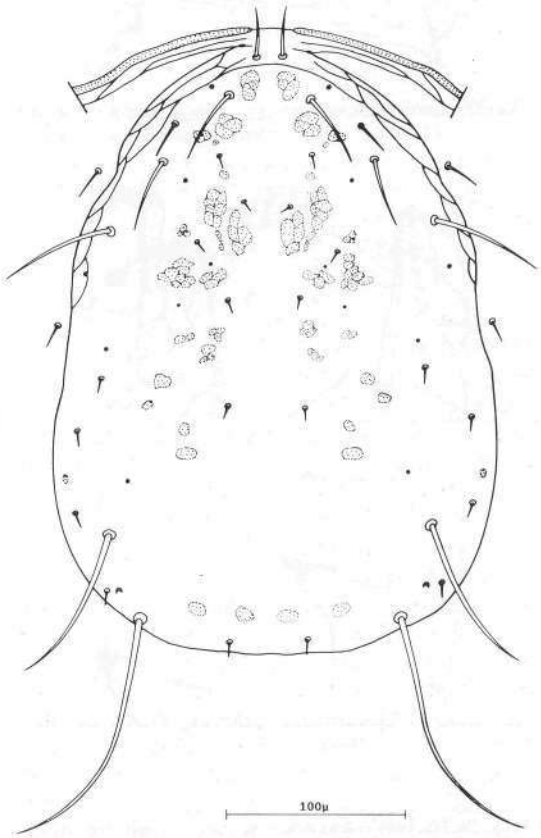

FIG. 26. *Amblyseius nemorivagus*: female, dorsal shield.

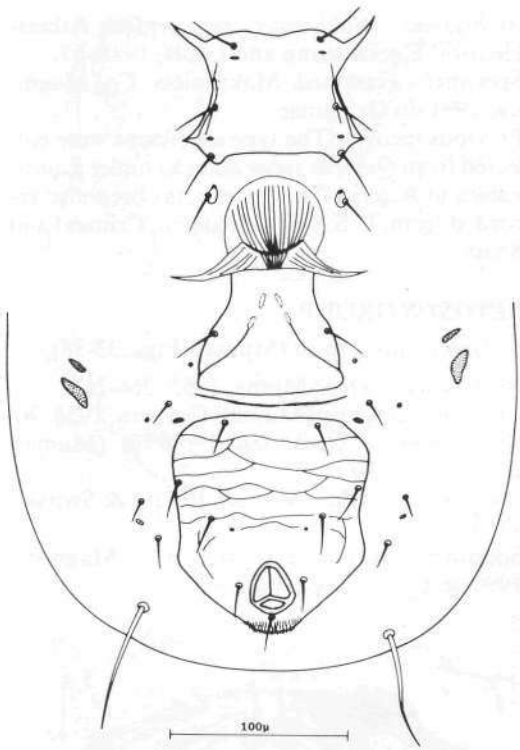

FIG. 27. *Amblyseius nemorivagus*: female, venter.

Previous records: The type specimens were collected on *Citrus* in Florida (U.S.A.). This species has been also recorded on *Citrus* in Israel.

FINLANDICUS GROUP

7. *Amblyseius stipulatus* (Athias-Henriot) (Figs. 39-44).

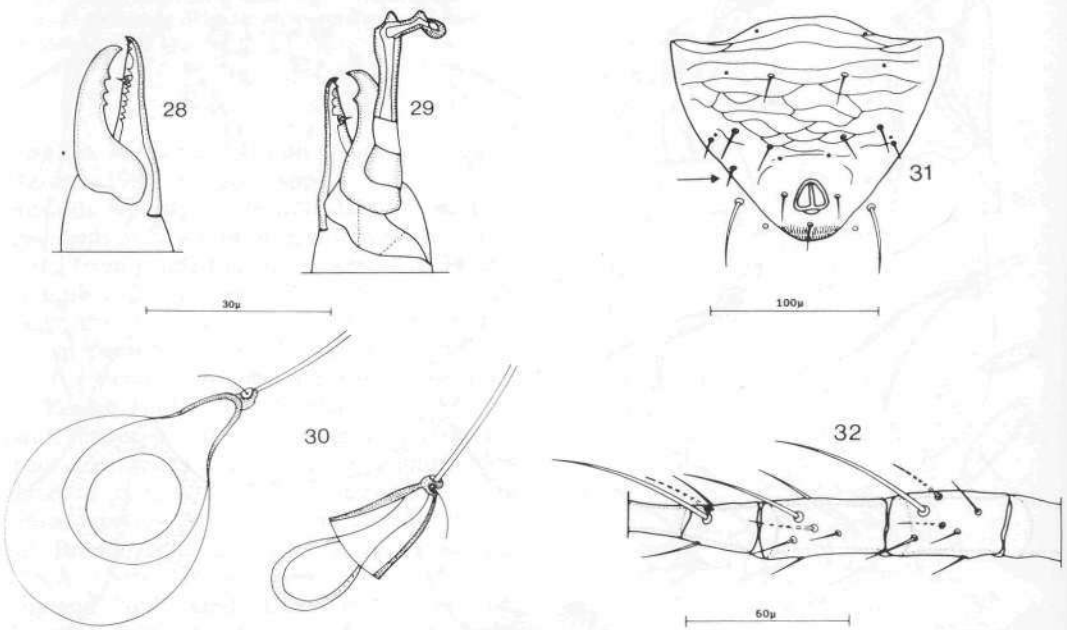
Amblyseius finlandicus (Oudemans); Athias-Henriot 1958: 3.

Amblyseius stipulatus Athias-Henriot, 1960: 294; Swirski & Ragusa, 1976: 119; Ragusa & Swirski, 1976: 192; Ragusa 1977: 386; Mc Murtry, 1977: 20.

Amblyseius (Amblyseius) stipulatus Athias-Henriot; Ueckermann & Loots, 1988: 110.

Specimens examined: In all citrus growing areas in Greece. This species is widespread, and the most dominant and frequent species on all *Citrus* spp. examined.

Previous records: This species was collected from *Citrus* spp. and other plants (Athias-Henriot, 1958) in Algeria. She mistook this species for *A. finlandicus* (Oudemans). This species has been also recorded from: Greece, Italy, Turkey and Spain.



FIGS. 28-32. *Amblyseius nemorivagus*: 28 chelicerae of female, 29 chelicerae of male, 30 spermatheca, 31 ventroanal shield of male, 32 leg IV of female.

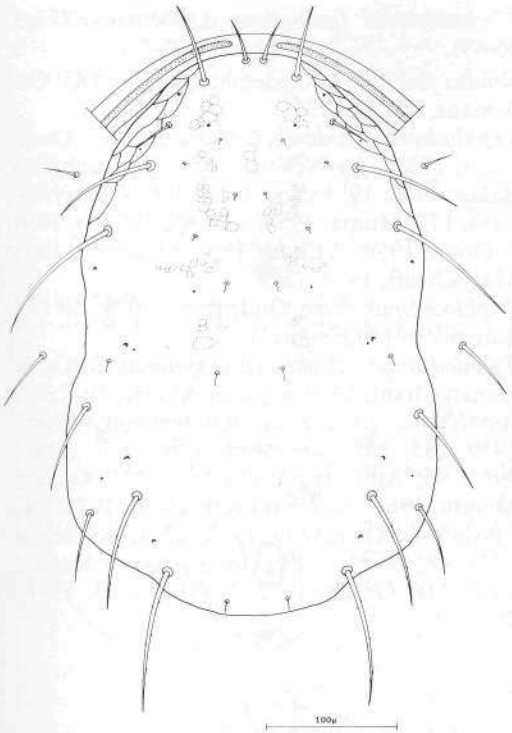


FIG. 33. *Amblyseius setosus*: female, dorsal shield.

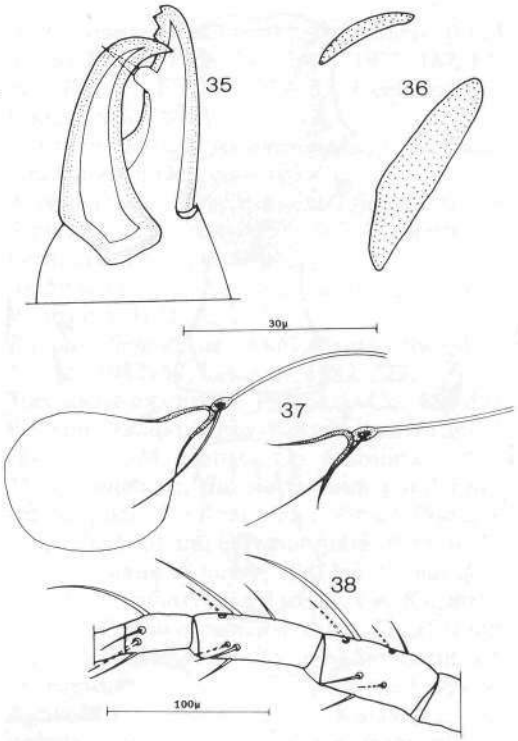

FIGS. 35-38. *Amblyseius setosus*: 35 chelicerae of female, 36 metapodal plates, 37 spermatheca, 38 leg IV.

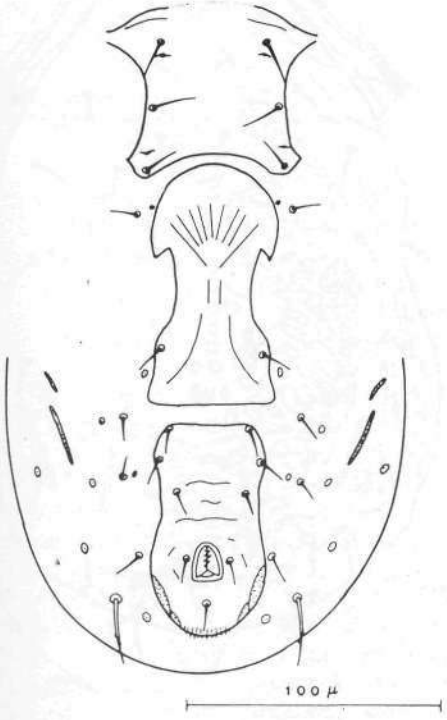

FIG. 57. *Amblyseius keae*: female, venter.

Attica, 1988 on *Flomis fruticosa*; and Karditsa, 1990 on *Ulmus* sp.

Previous records: The type specimens were found on *Tilia* sp. in the Netherlands. This species is well known in Europe (Germany, Italy, Switzerland, Hungary, Poland, Greece, England), U.S.S.R. (Crimea), Canada, U.S.A., Turkey, Israel and Algeria.

10. *Amblyseius keae* Papadoulis & Emmanouel (Figs. 56-61).

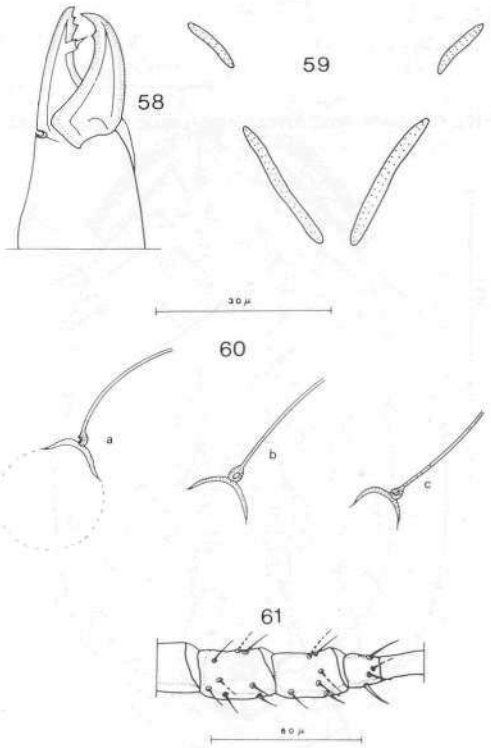
Amblyseius keae Papadoulis & Emmanouel, 1991: 265-269.

Specimens examined - Previous records: The type specimens were found on *Quercus aegilops* at Kea island of the Aegean Sea on October 2, 1988. This species is known only in Greece.

11. *Amblyseius hymetticus* Papadoulis & Emmanouel (Figs. 62-66).

Amblyseius hymetticus Papadoulis & Emmanouel, 1991: 265-269.

Specimens examined: Anilio, Pilio region, Co. Magnisia on *Pteris* sp.



FIGS. 58-61. *Amblyseius keae*: 58 chelicerae of female, 59 metapodal plates, 60 spermatheca, 61 leg IV.

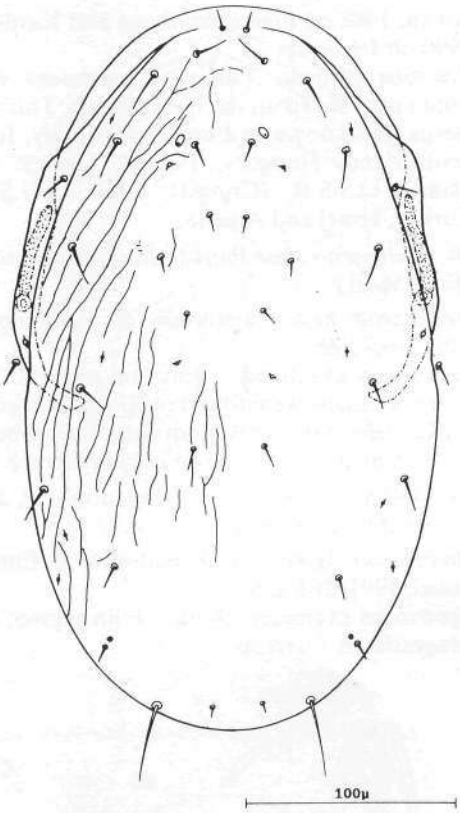


FIG. 62. *Amblyseius hymetticus*: female, dorsal shield.

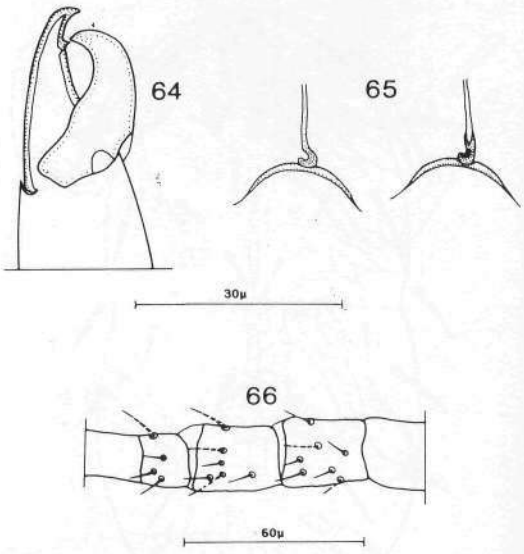

FIGS. 64-66. *Amblyseius hymetticus*: 64 chelicerae of female, 65 spermatheca, 66 leg IV.

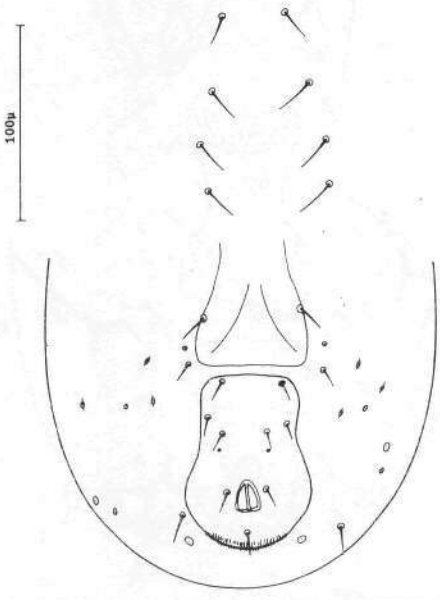

FIG. 63. *Amblyseius hymetticus*: female, venter.

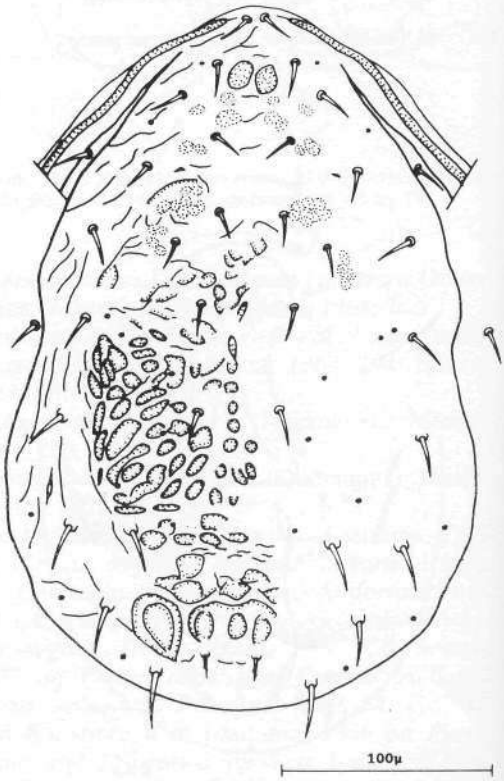

FIG. 67. *Amblyseius insuetus*: female, dorsal shield.

Previous records: The holotype female and 5 paratypes were collected from an unidentified plant of the family Labiatae at Hymettos mountain Attica on May 1, 1983. This species is known only in Greece.

NEWSAMI GROUP

12. *Amblyseius insuetus* Livshitz & Kuznetsov (Figs. 67-72).

Amblyseius insuetus Livshitz & Kuznetsov,1972: 27.

Specimens examined: Limni, Co. Evia, 1990 on *Tamarix* sp.; Argos, Co. Argolis, 1991 on Graminae.

Previous records - Remarks: It is interesting to note that this species has been found previously only in Crimea (U.S.S.R.) on the same host *Tamarix* sp. Generally, it seems that the Phytoseiid fauna of Crimea has many similarities to that of Greece (Papadoulis, unpublished).

CUCUMERIS GROUP

Amblyseius mackenziei Schuster & Pritchard, 163: 268 (Synonymy by Ragusa & Athias-Henriot, 1983).
Amblyseius oahuensis Prasad, 1968: 1518 (Synonymy by Ragusa & Athias-Henriot, 1983).
Amblyseius mycophilus Karg, 1970: 290 (Synonymy by Ragusa & Athias-Henriot, 1983).
Amblyseius picketti Specht, 1968: 681 (Synonymy by Ragusa & Athias-Henriot, 1983).
Specimens examined: This species was found in all cultivated and uncultivated graminae samples collected in Greece. It was also found at Kopais region, Co. Boiotia, 1986 on *Medicago sativa*; Kalamata, Co. Messinia, 1986 on *Plantago* spp.; Messara, Co. Heraklion, Crete, 1986-87 on *Sonchus oleraceus* and *Solanum nigrum*; Spata, Co. Attica, 1990 on *Vitis vinifera*.
Previous records: The type specimens were collected from plumules of germinating barley on the London docks, England. This species has been also recorded from: Italy, Spain, Germany, U.S.A., U.S.S.R., Algeria, Mozambique, Madagascar, South Africa, Zimbabwe, Egypt, Israel, Japan and Guinea.

18. *Amblyseius bicaudus* Wainstein (Figs. 104-110).

Amblyseius bicaudus Wainstein, 1962, Arutunjan, 1969; Livschitz & Kuznetsov, 1972: 26; Athias-Henriot, 1966; Ragusa & Paoletti, 1986: 78-79; Papadoulis & Emmanouel, 1990: 14.
Specimens examined: This species was found to be the most dominant and frequent of all Phytoseiid mites occurring on cultivated and uncultivated graminae in Greece. It was also found at Evia, 1987 on *Capsicum annum*; Polykastro, Co. Kilkis, 1986 on *Vicia* sp.
Previous records: The type specimens were found on cereals in Alma Ata (U.S.S.R.). This species has been also recorded from: France, Italy and U.S.S.R. (Armenia, Crimea).

19. *Amblyseius makedonicus* spec. nov. (Figs. 111-116).

Description

FEMALE
Dorsum (Fig. 111). Dorsal setal pattern 10A: 9B (r3 off, R1 off). Ventral setal pattern 14:

JV-3:ZV. Dorsal shield sclerotized, reticulated with seven pairs of relatively inconspicuous solenostomes: posterolateral to j3, mediad to j4, posteromediad to j5, posteriad to s4, anteromediad to J1, anteriad to z4 and anteromediad to S5. Twelve pairs of small pores (sensillae) visible, on dorsal shield. Muscle marks (sigilles) visible, mostly on podosoma. Length of dorsal shield (j1-J5) 387 (381-390); Width (distance between bases of S2) 221 (211-230). All dorsal setae smooth except Z5 which is faintly serrated. Sublateral setae r3 and R1 on interscutal membrane, smooth. Measurements of setae as follows: j1 25, j3 32 (31-32), j4 15 (14-16), j5 14 (13-14), j6 19 (18-20), J2 20, J5 13 (13-14), z2 24 (22-25), z4 25 (23-27), z5 14 (13-16), Z1 24 (23-25), Z4 51 (49-54), Z5 88 (86-90), s4 38 (36-40), S2 31 (29-32), S4 28 (27-31), S5 32 (31-34), r3 26 (23-27) and R1 23 (22-25). Peritremes very long 233 (230-239) in length (from stigma to apex) extending anteriorly the level of j1.

Venter (Fig. 112). Sternal shield sclerotized with three pairs of setae (ST1, ST2, ST3) and two pairs of pores (pst1, pst2); lateral margin of shield slightly lineated. Length (ST1-ST3) 73 (72-74), width (ST2-ST2) 70. Metasternal setae (MS) and a pair of pores (pst3) on platelets. Genital shield with weak lineate ornamentation on lateral margins; width (at level of setae G) 73 (73-76); pst5 laterally on posterior part of genital shield. Ventroanal shield reticulated with 3 pairs of preanal setae (JV1, JV2, ZV2), anal setae (a1, a2, a3) and a pair of solenostomes posteriad of the base of setae JV2. Distance between solenostomes 56 (50-61). Muscle marks visible posteriolaterally. Length of ventroanal shield 135 (131-139), width (at level of setae ZV2) 122 (119-124). Setae JV4, JV5, ZV1, ZV3 on integument surrounding ventroanal shield. Setae JV5 longer 66 (65-68) than others. Metapodal plates as shown in Fig. 114. Length of primary metapodal plates 22 (20-23), width 5. In addition to pst5 at least 6 pairs or pores present on ventral interscutal membrane.

Chelicerae (Fig. 113). Fixed digit with four visible teeth and *pilus dentilis*; movable digit without teeth.

TABLE 1. Comparison of setal lengths of females of *Amblyseius makedonicus* spec. nov. with those of related species.

Setae	*Amblyseius makedonicus**	*Amblyseius paramarinus***	*Amblyseius marinus****	*Amblyseius reticulatus*****
j3	32 (31-32)	20-22	–	23
Z4	51 (49-54)	40-43	32	39
Z5	88 (86-90)	59-66	48	55
s4	38 (36-40)	23-24	28	55
S2	31 (29-32)	20-23	–	23
S4	28 (27-31)	20-23	–	20
S5	32 (31-34)	20-23	–	20

stiIV	47 (45-49)	38-40	–	28
stIV	83 (81-86)	66-68	52	45

* From 5 specimens
** From Evans (1988)
*** From Evans (1987)
**** From Kolodochka (1988)

Legs, Palps (Fig. 116). Measurements of legs (base of coxae to base of claws) and palp (base of trochanter to apex of tarsus) as follows: Leg I 372 (367-376), Leg II 295 (294-298), Leg III 296 (294-298), Leg IV 407 (404-409) and Palp 115. Genu II with eight setae (2-2/0-2/1-1). Leg IV with three macrosetae: genu 46 (45-49) long, tibia 47 (45-49) and basitarsus 83 (81-86).

Spermatheca (Fig. 115). Cervix funnel-shaped. Atrium connected with relatively short neck of the same breadth as the tube-like major duct. Minor duct visible.

MALE. Unknown.

TAXONOMIC NOTES - DIAGNOSIS

A. makedonicus is most similar to *A. paramarinus* (Evans). It is also close with *A. marinus* (Willmann) and *A. reticulatus* (Oudemans), as they have been redescribed by Evans 1987 and Kolodochka 1988, respectively. The new species can be readily distinguished from the latter two species by the neck of the spermatheca (much shorter or absent in *A. reticulatus* and longer in *A. marinus*). In addition, the movable digit of *A. reticulatus* bears two teeth instead of none as in *A. makedonicus*. The setal lengths of the above four species are shown in Table I. All setae are much longer in *A. makedonicus* than in *A. paramarinus*. Additionally, the ratio of Z5/Z4 is 1,75 and 1,5 respectively.

TYPE MATERIAL

The holotype female, collected on *Oryza sativa* at Thessaloniki region on October 11, 1987, and 4 female paratypes with the same data are deposited in the Acari collection, Laboratory of Agricultural Zoology & Entomology, Agricultural University of Athens, Greece.

ETYMOLOGY

The name of this new species is derived from Makedonia of Northern Greece where it was found.

Acknowledgments

We are grateful to Prof. G.O. Evans, England and Mrs. E. Shaul, University of Toronto for their useful suggestions concerning the identity of the new species.

Γεωργικό Πανεπιστήμιο Αθηνών

ΠΕΡΙΛΗΨΗ

Η μελέτη των ακάρεων της Οικογένειας Phytoseiidae στην Ελλάδα, έδειξε την παρουσία 19 ειδών, τα οποία ανήκουν στο γένος *Amblyseius*. Από αυτά το *A. makedonicus*, το οποίο ευρέθη στο φυτό *Oryza sativa*, περιγράφεται και σχεδιάζεται ως νέο είδος στην επιστήμη. Δίδονται επίσης κλειδί προσδιορισμού, τα συνώνυμα και περισσότερο λεπτομερή και ακριβή (των προηγουμένων περιγραφών) σχέδια θηλυκού ή και αρσενικού για όλα τα ανευρεθέντα στην Ελλάδα είδη *Amblyseius*, καθώς και πληροφορίες της παγκόσμιας εξάπλωσης αυτών. Αναφέρονται ακόμα οι ξενιστές και η γεωγραφική εξάπλωση των ακάρεων αυτών στην Ελλάδα.
