**Table S1:** Results of ANOVA mean comparison tests for seasonal variation of biochemical and isotopic parameters in each plant part and leaf epibionts (\*\*\*)  $p < 0.001$ , \*\*  $p < 0.01$ , \*  $p < 0.05$ , ns  $p > 0.05$ ). Results of post-hoc tests are provided, with letters standing for the season (Sp: Spring, Su: Summer, A: Autumn, W: Winter). For leaves and rhizome, protein is calculated as %N  $\times$  4.28.

<sup>a</sup> Calculated from authors' figure

<sup>b</sup> Nonstructural carbohydrate content

<sup>c</sup> Starch

<sup>d</sup> Calculated from authors' figure

<sup>e</sup> Extrapolated from another article of the same authors

<sup>f</sup> Ash mass putatively over-evaluated, possibly due to the non-removing of leaf calcareous epibiota

<sup>g</sup> Possibly under-evaluated, due to the over-evaluation of ash (see <sup>f</sup>)

<sup>i</sup> C:N:P ratio

<sup>j</sup> Obviously erroneous values. The authors may have inverted the values of the proteins and total carbohydrates.

<sup>k</sup> The authors calculated protein content from total nitrogen, according to an Atwater coefficient of 6.25
